

Hotel Facilities

A hotel booking system needs a database to keep track of its rooms. You create **hotel_db** with a table called **rooms**.

- ☐ Each room is identified by a **primary** positive **room_no**.
- ☐ The **room_type** can be Single, Double, or Suite, but if nothing is specified, it **defaults** to Single.
- ☐ To give guests clarity, the system also records **facilities** such as WiFi, TV, AC and Balcony for each room.

Step 1 : **in L3** **create hotel.sql**

```
C:\mysql_july26\L3>notepad hotel.sql
```

Step 2: **write the code**

```
drop database if exists hotel_db;
create database if not exists hotel_db;
use hotel_db;

create table if not exists rooms
(
    room_no int unsigned primary key,
    room_type enum('single', 'double', 'suite') default 'single',
    facilities set('wifi', 'tv', 'ac', 'balcony')
);
desc rooms;

insert into rooms values(201, 'double', 'wifi,tv');
insert into rooms values(202, default, 'wifi,balcony,ac');
select * from rooms;
```

Step 3: **run the code from mysql prompt**

```
mysql> source C:\mysql_july26\L3\hotel.sql
```

Music Streaming Playlist Preferences

A music app wants to track what its listeners enjoy.
You create **music_db** with a table called **listeners**.

- ☐ Each listener has a unique positive **user_id**.
- ☐ Their **name** can be stored up to 50 characters and is required.
- ☐ Every **account** is either Free or Premium, but by default, it starts as Free.
- ☐ To personalize the experience, the app records **preferences** such as Songs, Podcasts, Audiobooks, or Live Concerts, if nothing specified then default to songs.
